Sinks that make sense

This is the way a diagonal corner sink should be designed!

Notice how much further away from you the rectangular sink must be in order to achieve a decent width. On top of that, the drain will likely be in the middle making that huge cabinet basically unusable.

My design brings you closer to the work area, thus less bending - no back ache! I suggest a right drain (shown in pink) for right handed users and a left drain for lefties! Now the entire sink cabinet is useable. Imagine paying for a cabinet you can not use!! ***Ridiculous!***
